

# Dynamic programming

Ibrahim Numanagić

# Introduction

- Dynamic programming is a fancy name for complete search (brute force) that "remembers" the already seen states

already solved by blue; no need to repeat calculation by red!

- Key ideas:
  - Find how to encode substates of the problem
  - Make sure that substates / subtrees are independently solvable
  - Make sure to remember already seen substates (e.g. hashmap)

# Introduction

- When to use?
  - Anything that requires counting (count the number of ways to do X or Y)
  - Anything that requires optimization (find the largest / smallest item, best / worst score etc.)
  - Anything that requires optimality (find the optimal cut) and that can be done by enumerating all possibilities

# Two DP modes

- Top-down DP:
  - Just do standard recursion, remember what you have seen
  - Hint: sub states are usually the recursion parameters that keep changing (if your recursion is correct)
- Bottom-up DP:
  - Tabular method: fill the table from the smallest substate to the largest one
  - Reversed top-down approach
- Neither is "better"
  - Top-down is easier to reason about and might use less memory
  - Bottom-up might be faster as you do not waste time on recursion calls

# 1D optimization: BABTWR

- BABTWR
  - n different types of blocks are available. Each one of them may be duplicated as many times as you like. Each type has a height  $y$ , a width  $x$  and a depth  $z$ . The blocks are to be stacked one upon each other so that the resulting tower is as high as possible. Of course the blocks can be rotated as desired before stacking. However for reasons of stability a block can only be stacked upon another if both of its baselines are shorter.
- Input
  - The number of types of blocks  $n$  is located in the first line of each test case. On the subsequent  $n$  lines the height  $y_i$ , the width  $x_i$  and the depth  $z_i$  of each type of blocks are given. There are never more than 30 different types available. There are many test cases, which come one by one. Input terminates with  $n = 0$ . Edited: You can assume that  $\max(x_i, y_i, z_i) \leq 2500$ .
- Output
  - For each test case your program should output one line with the height of the highest possible tower.

Sample input:

```
5
31 41 59
26 53 58
97 93 23
84 62 64
33 83 27
1
1 1 1
0
```

Sample output:

```
342
1
```

# 1D optimization: BABTWR

notes:

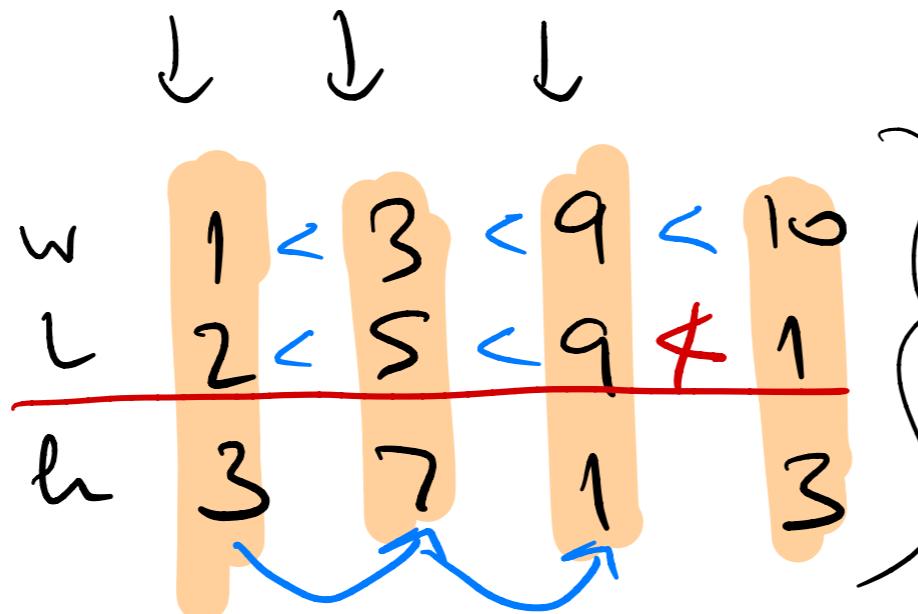

- ① each block can be used max. 3 times (3 rotations) due to stackup constraint

- ② form a list  $L$  of ALL rotations (3 of them) of each cube

- ③ Sort  $L$

- ④ do a variant of LIS on  $L$  ( $O(n^2)$  is enough to get AC)

(only  $w$  and  $l$  matter for LIS;  $h$  is used for the sum)

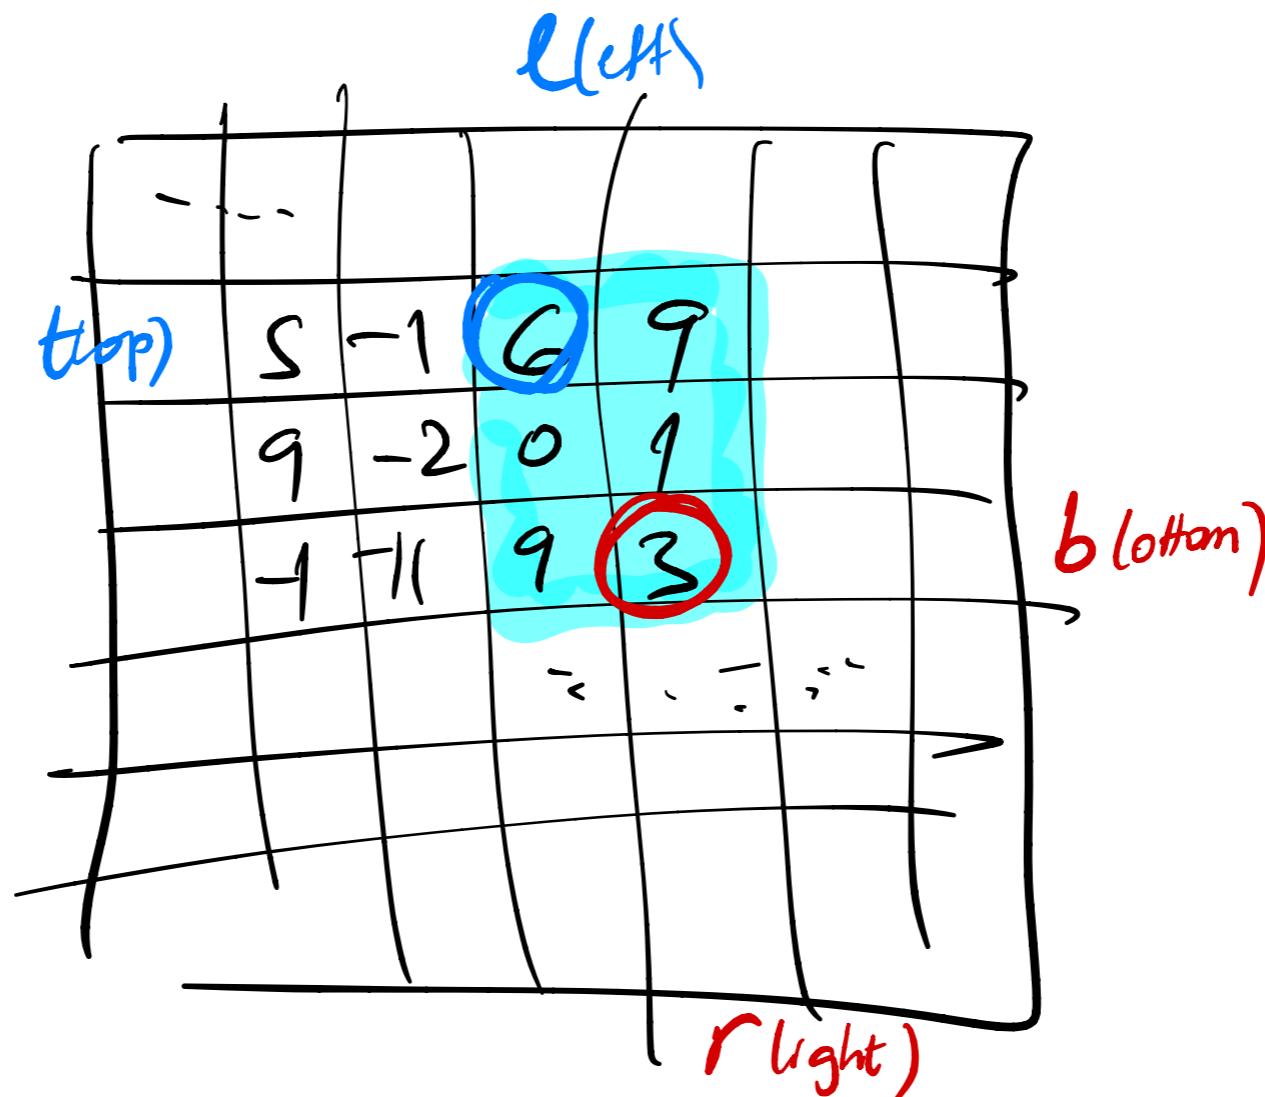

List  $\underline{L}$   
(do LIS on  $w \& l$ ,  
keep sum of  $h$ 's  
as the "length")

# 2D counting: cumulative sums

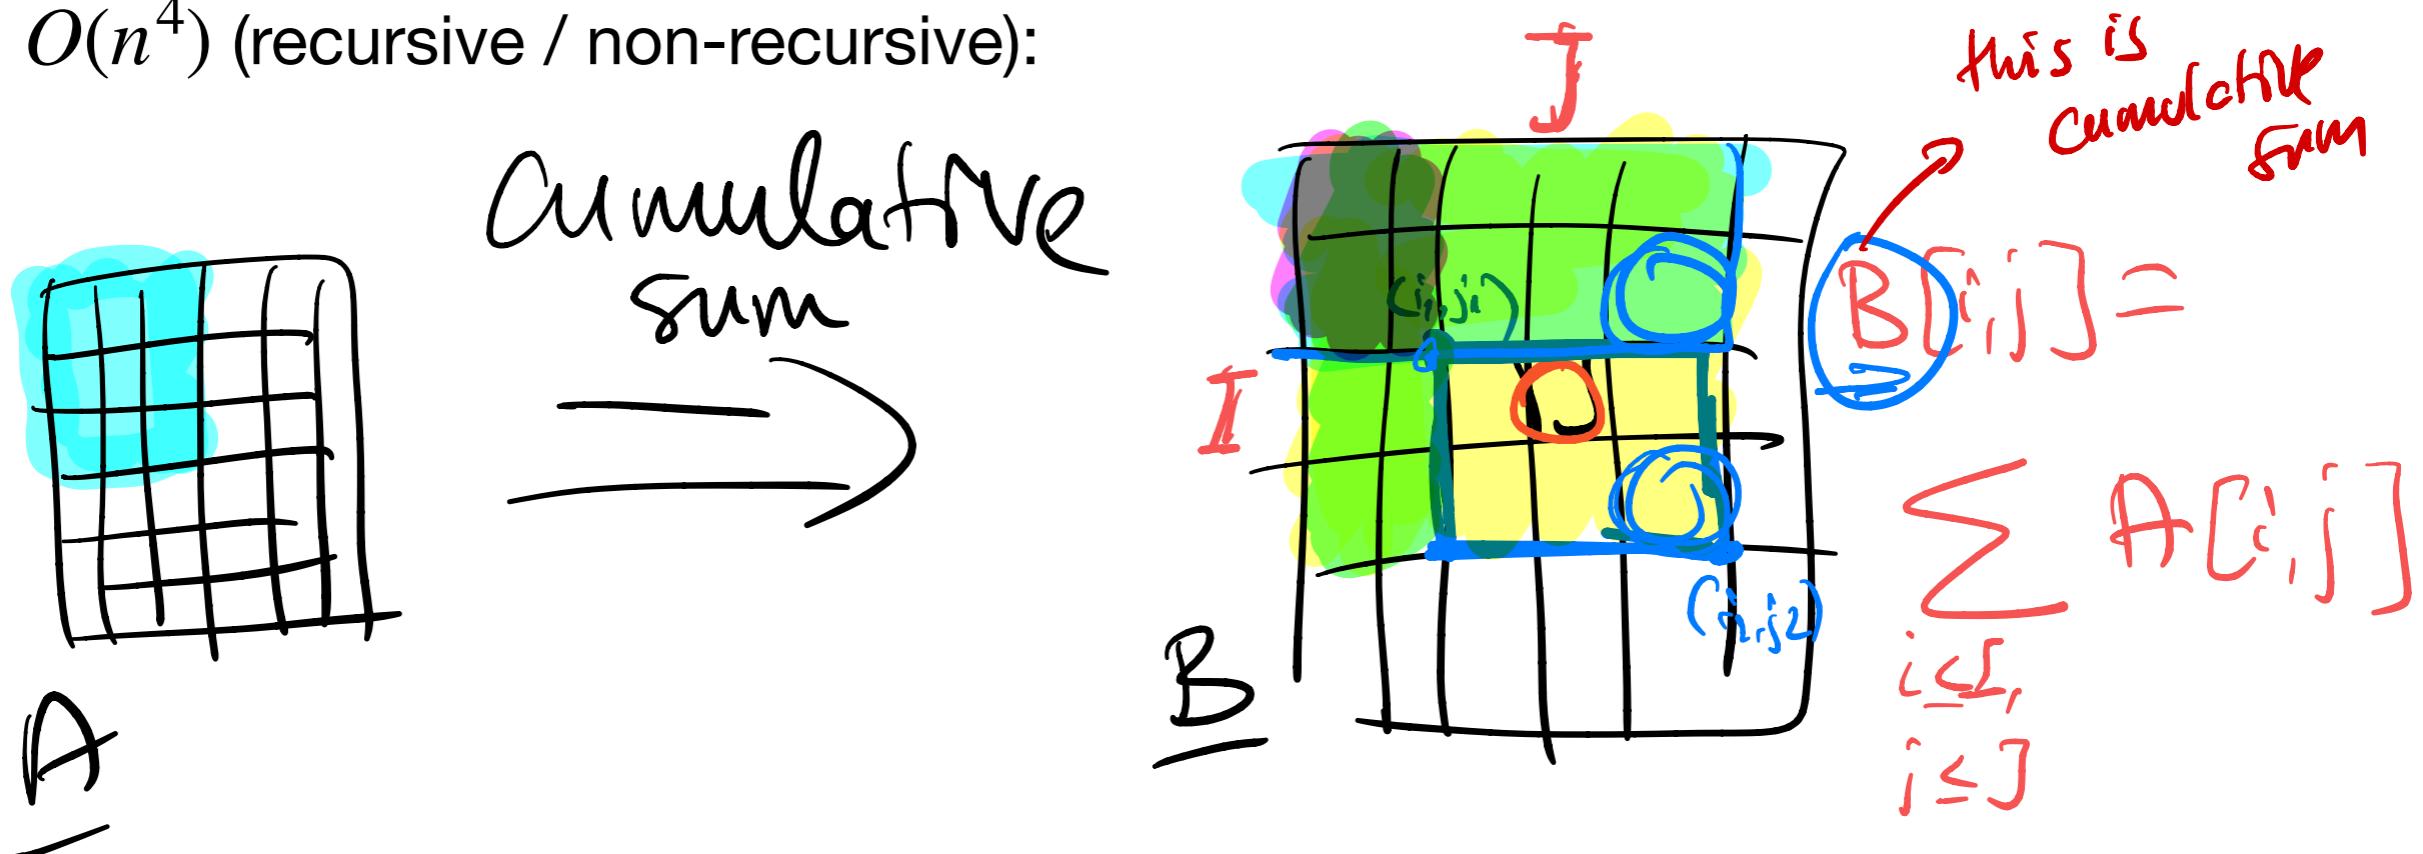

- UVa 108: [https://onlinejudge.org/index.php?  
option=onlinejudge&Itemid=8&page=show\\_problem&problem=44](https://onlinejudge.org/index.php?option=onlinejudge&Itemid=8&page=show_problem&problem=44)
- $O(n^6)$ :

for each  $(t, l)$   
for each  $(b, r)$   
sum matrix  
 $[(t, l) \rightarrow (b, r)]$

# 2D counting: cumulative sums

- UVa 108: [https://onlinejudge.org/index.php?  
option=onlinejudge&Itemid=8&page=show\\_problem&problem=44](https://onlinejudge.org/index.php?option=onlinejudge&Itemid=8&page=show_problem&problem=44)
- $O(n^4)$  (recursive / non-recursive):

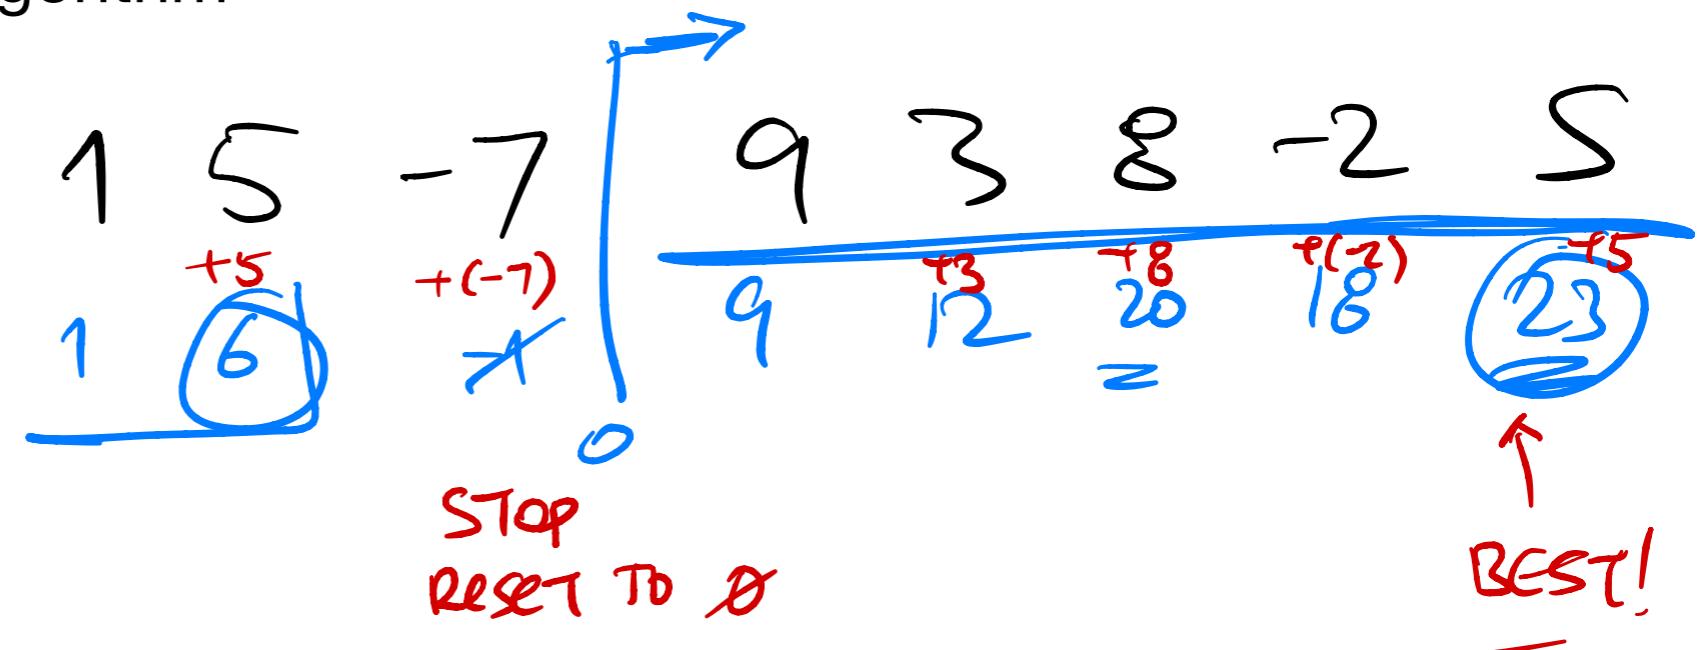

$$\begin{aligned} \text{Sum} &= B[i_2, j_2] - B[i_1-1, j_2] - B[i_2, j_1-1] \\ &\quad + B[i_1-1, j_1-1] \end{aligned}$$

# 2D counting: cumulative sums

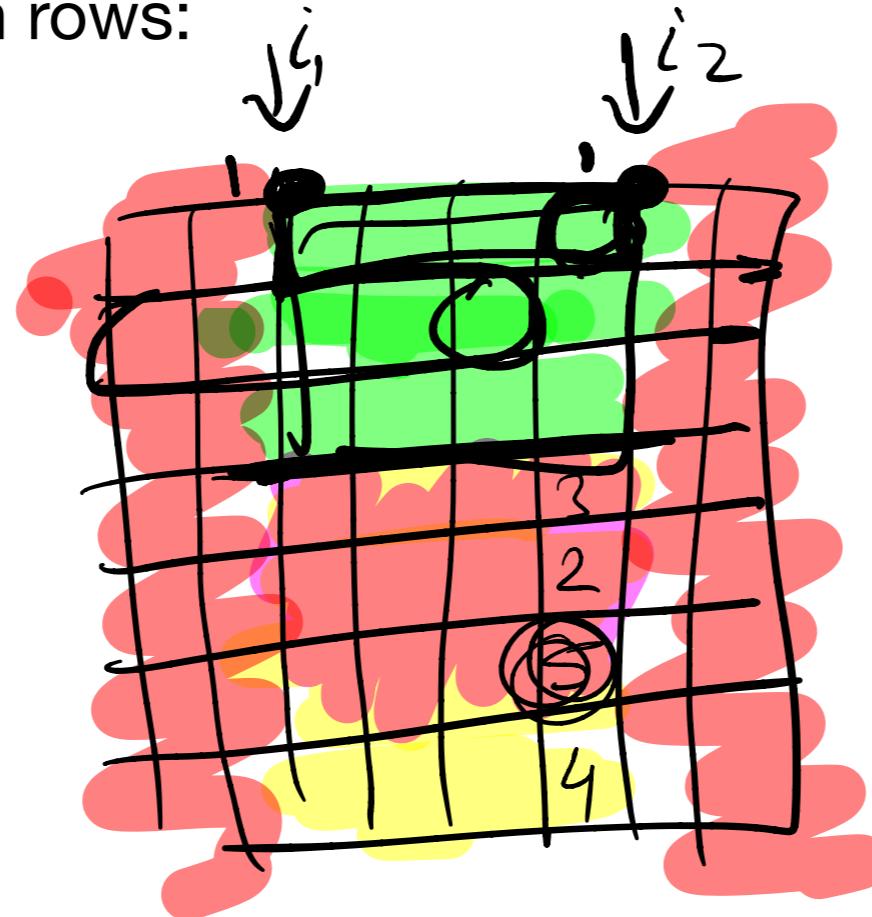

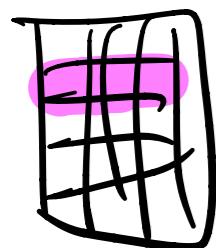

- UVa 108: [https://onlinejudge.org/index.php?  
option=onlinejudge&Itemid=8&page=show\\_problem&problem=44](https://onlinejudge.org/index.php?option=onlinejudge&Itemid=8&page=show_problem&problem=44)
- Detour: Kadane's algorithm

1D array:

# 2D counting: cumulative sums

- UVa 108: [https://onlinejudge.org/index.php?  
option=onlinejudge&Itemid=8&page=show\\_problem&problem=44](https://onlinejudge.org/index.php?option=onlinejudge&Itemid=8&page=show_problem&problem=44)
- $O(n^3)$  Kadane on rows:

*Cumulative sum of  
ROWS!*

$$B[i, j] = \sum_{i' \leq j} A[i', j]$$

ALG:

for column  $i_1$   
for column  $i_2$   
for row  $r$

[ if  $\text{sum} + [B[r, i_2] - B[r, i_1]] \geq 0$ :  
 $\text{sum} += B[r, i_2] - B[r, i_1]$   
check if this is the largest  
sum so far  
else:  
 $\text{sum} = 0$

# 2D counting: cumulative sums

- Variations:
  - Find a submatrix with smallest mean
  - Find a submatrix with all ones if input is 0/1 matrix
  - Find a largest submatrix by area containing all ones if input is 0/1 matrix
  - Find a largest square submatrix containing all ones if input is 0/1 matrix
  - Find the number of submatrices containing all zeros (or ones) if input is 0/1 matrix (Google Interview)

# 2D and 3D optimization: edit distance

- Given two strings, find minimum number of changes needed to convert the first into the second
- <https://onlinejudge.org/external/131/13146.pdf>
- Subproblems: substrings

$s_1: A \ C \ G \ G \ T$   
 $s_2: A \ C \ C \ - \ T$

mismatch  
deletion from  $s_2$

Recurrence:

$$\text{ed}[i,j] = \min \left\{ \begin{array}{l} \text{ed}[i-1, j-1] + \begin{cases} 1 & \text{if } s_1[i] \neq s_2[j] \\ 0 & \text{otherwise} \end{cases} \\ \text{ed}[i-1, j] + 1 \\ \text{ed}[i, j-1] + 1 \end{array} \right.$$

$\text{ed}[i,j]$  is edit distance of  $s_1[1..i]$  and  $s_2[1..j]$   
(SUBPROBLEMS: prefixes of  $s_1$  and  $s_2$ )

# 2D and 3D optimization: edit distance

- Given two strings, find minimum number of changes needed to convert the first into the second
- <https://onlinejudge.org/external/131/13146.pdf>
- Change: find the closest substrings!

$$\text{ed}(i,j) = \max \begin{cases} \text{ed}(i-1, j-1) + \max \begin{cases} 1 & \text{if } s_1(i) = s_2(j) \\ -1 & \text{otherwise} \end{cases} \\ \text{ed}(i-1, j) - 1 \\ \text{ed}(i, j-1) - 1 \\ 0 \end{cases}$$

*difference!  
w/ prev. slide*

The diagram shows two horizontal strings. The top string is labeled "ACCGATC" with a red wavy line above it and another below it. The bottom string is labeled "AEGGATC" with a red wavy line above it and another below it. A green horizontal bar is placed under the letters "GATC" in the top string and "GGT" in the bottom string. A small green dot is placed above the "C" in the top string's underline.

# 2D and 3D optimization: edit distance

- Reconstruction:

# 2D and 3D optimization: edit distance

- Given two strings, find minimum number of changes needed to convert the first into the second
- Change: gaps can be affine (e.g. we have gap open and gap extension cost)!

Match	Unmatch	gap open	gap extend
5	-4	-10	-1
5 5 -1 -1 + 5 A C C C C T A C - - - T <u>1</u> <u>2</u>	5 -1 5 -1 + 5 A C C C C T A - C - - T <u>-8</u>	<i>open gap</i> -10 <i>open gap again!</i> -10	

# 2D and 3D optimization: edit distance

See *for more examples*:

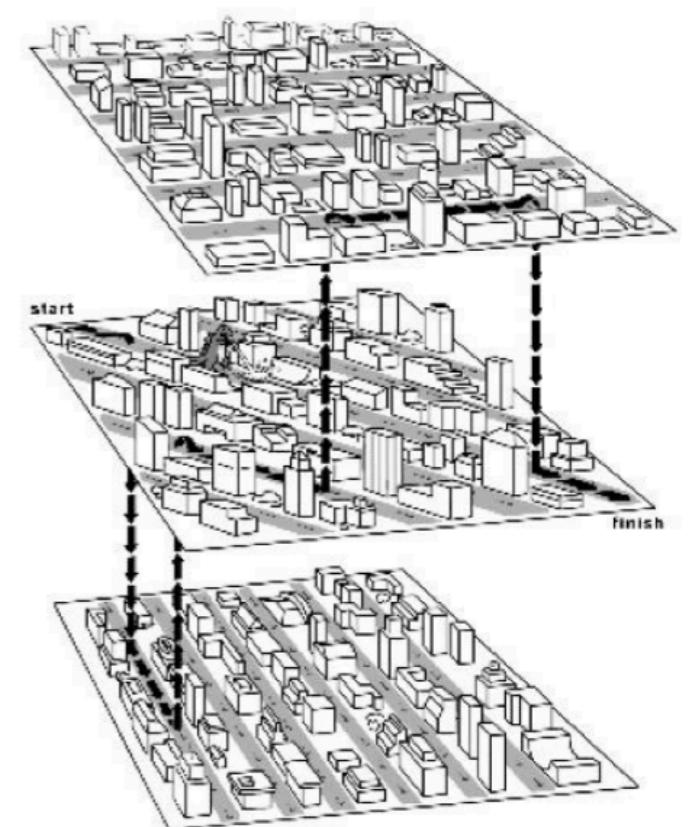

<https://www.cs.cmu.edu/~ckingsf/bioinfo-lectures/gaps.pdf>

- Given two strings, find minimum number of changes needed to convert the first into the second
- Change: gaps can be affine (e.g. we have gap open and gap extension cost)!

$$\underline{dp}(i, j) = \max \begin{cases} dp[i-1, j-1] + \text{match or mismatch dep. on } s_1[i] \neq s_2[j] \\ ig[i, j] \\ dg[i, j] \end{cases}$$

$$ig(i, j) = \max \begin{cases} ig(i-1, j) + \text{gap-extend} \\ dp(i-1, j) + \text{gap-open} + \text{gap-extend} \end{cases}$$

$$dg(i, j) = \max \begin{cases} dg(i, j-1) + \text{gap-extend} \\ dp(i, j-1) + \text{gap-open} + \text{gap-extend} \end{cases}$$

# 2D and 3D optimization: edit distance

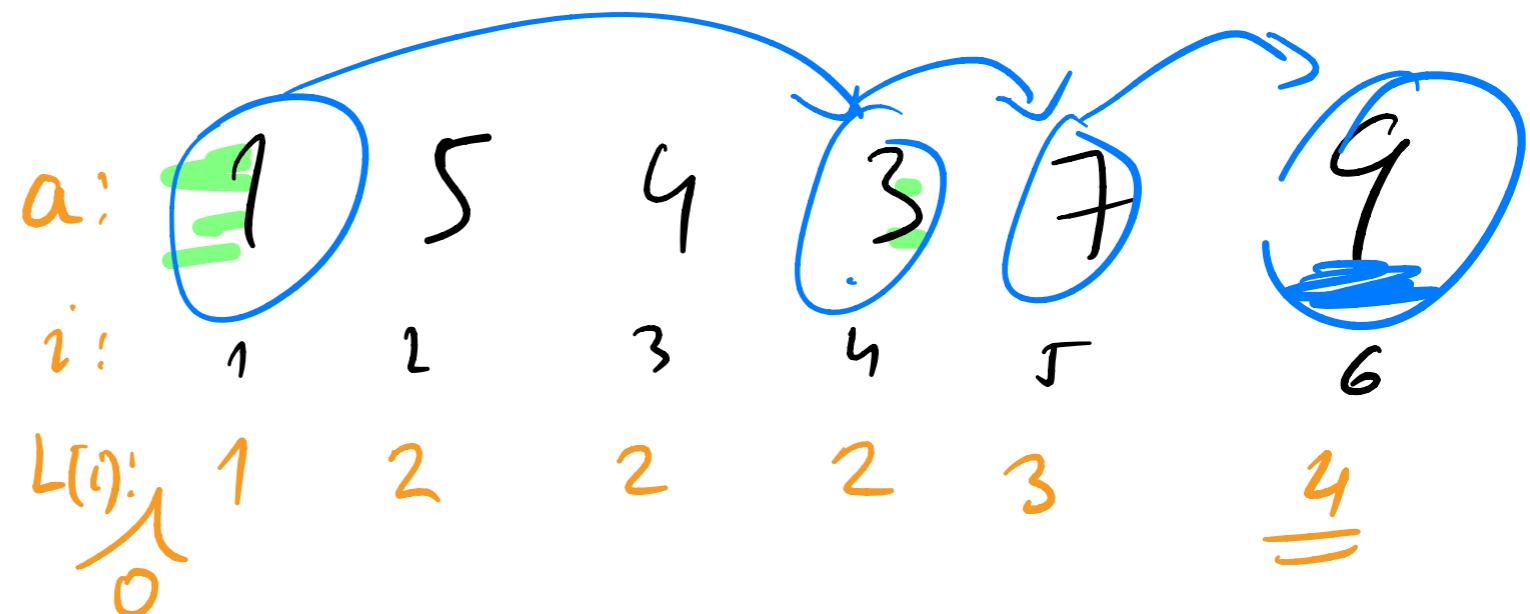

- Similar problems:
  - Longest common subsequence (mismatch is infinity)
  - <https://onlinejudge.org/external/100/p10029.pdf>
  - Most of the problems with typo detection, genome/DNA strings, string similarity etc.
  - The whole field of bioinformatics

# 1D optimization: LIS

- Find longest increasing subsequence
- <https://onlinejudge.org/external/127/p12747.pdf>
- $O(n^2)$ :

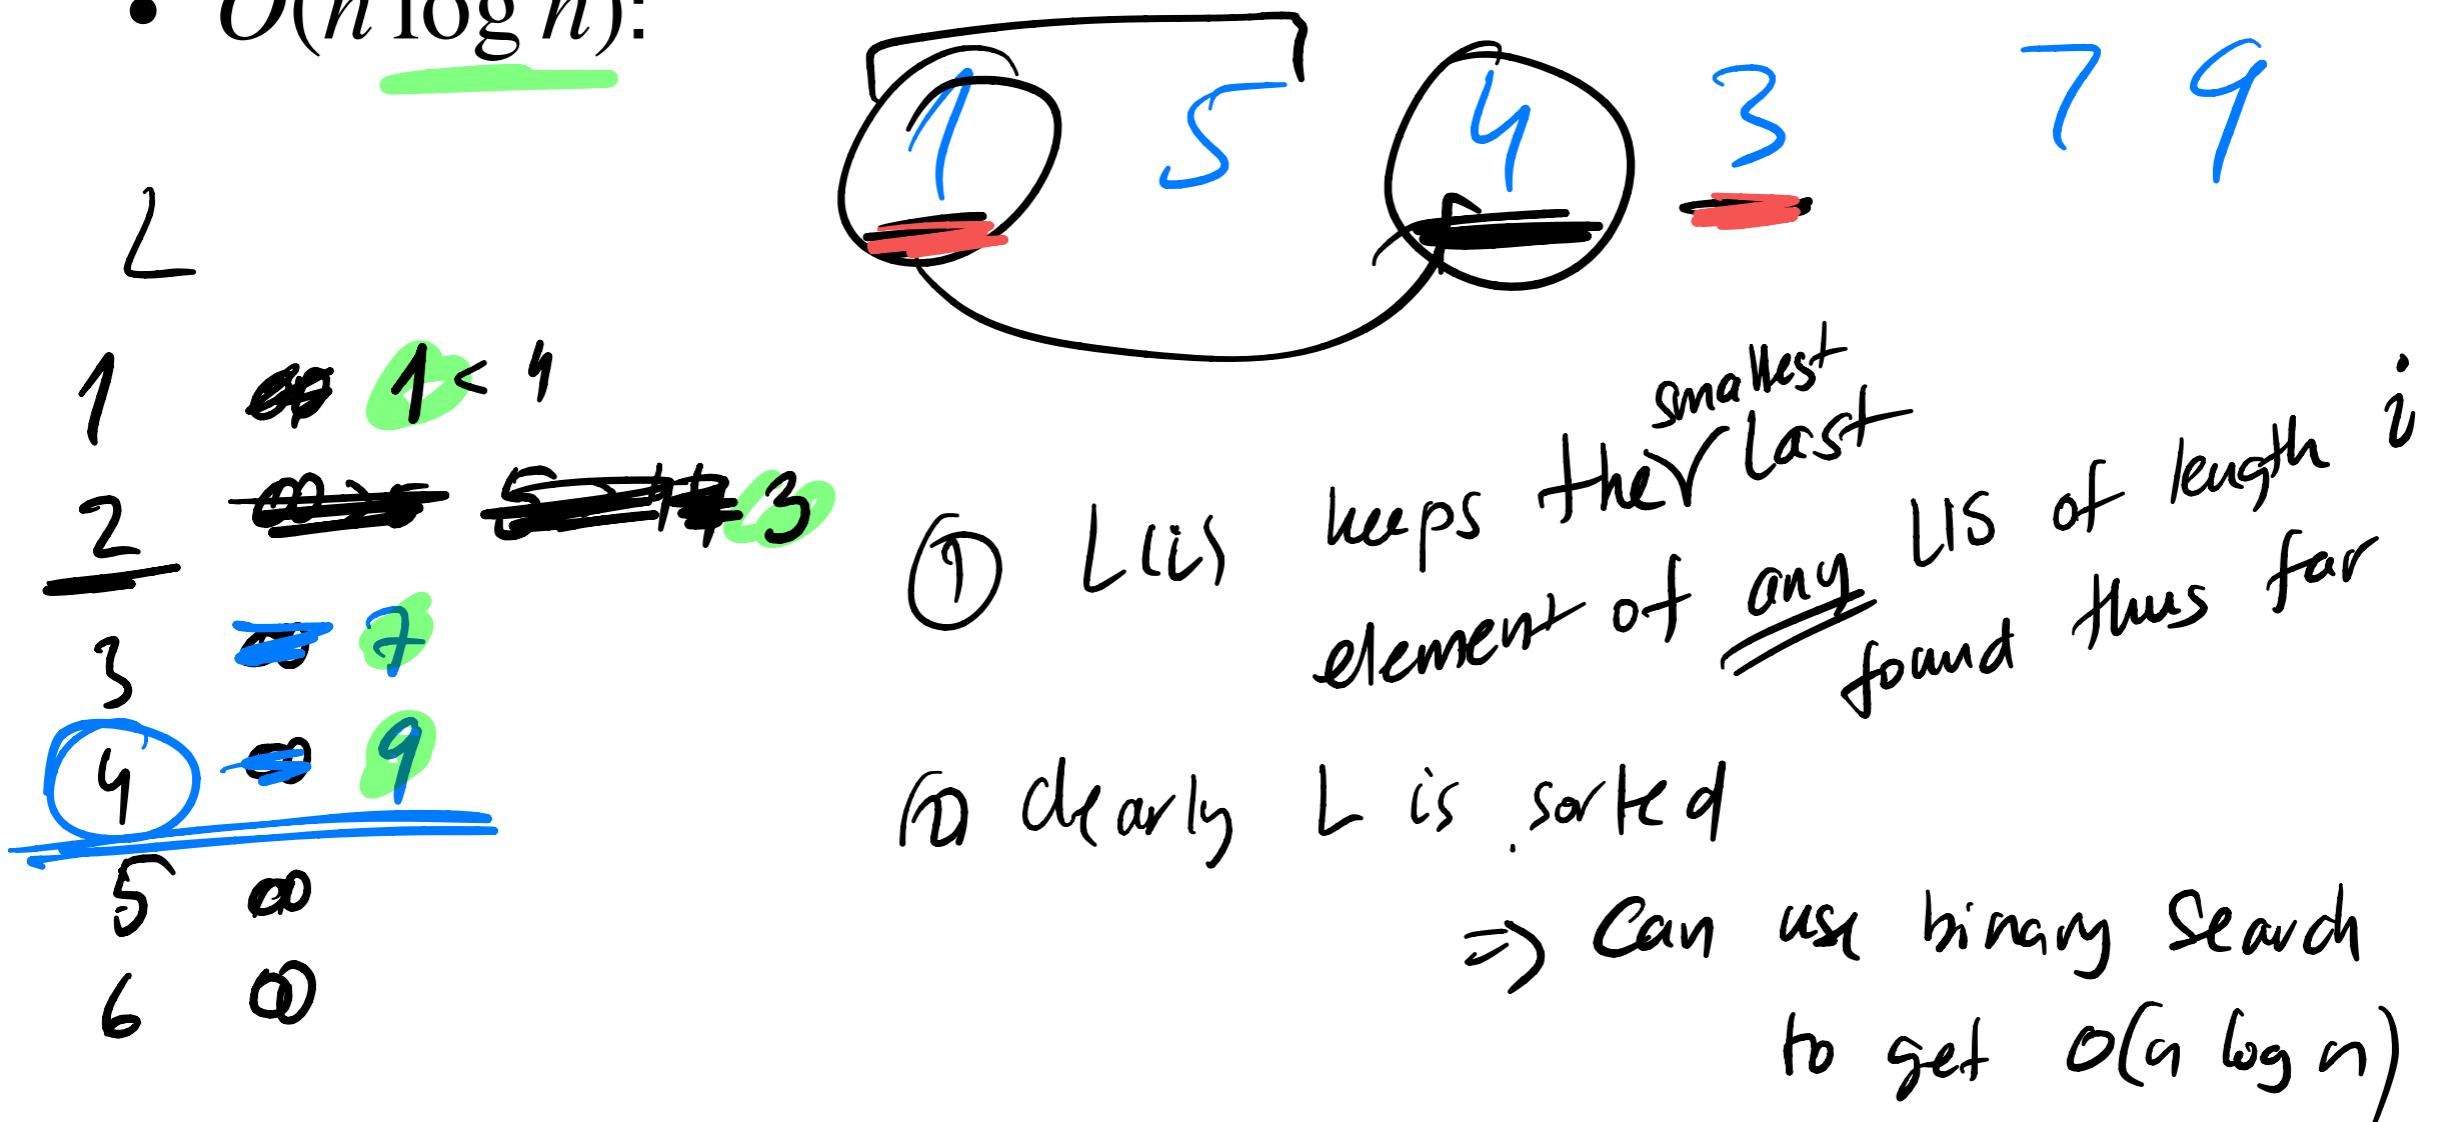

$$L(0) = 0$$

$$L(i) = \max_j \left\{ L[j] + 1 \text{ if } a[i] > a[j] \right\}$$

# 1D optimization: LIS

- Find longest increasing subsequence
- <https://onlinejudge.org/external/127/p12747.pdf>
- $O(n \log n)$ :

# Pseudo-polynomial memoization

- Coin change (<https://onlinejudge.org/external/6/674.pdf>)
- Similar to counting problems, but the size of the table is determined by the value

- pseudo-polynomial:  
complexity is  $O(n^V)$   
where  $V$  is max. value  
 $(V$  is not polynomial on  $n!$ )

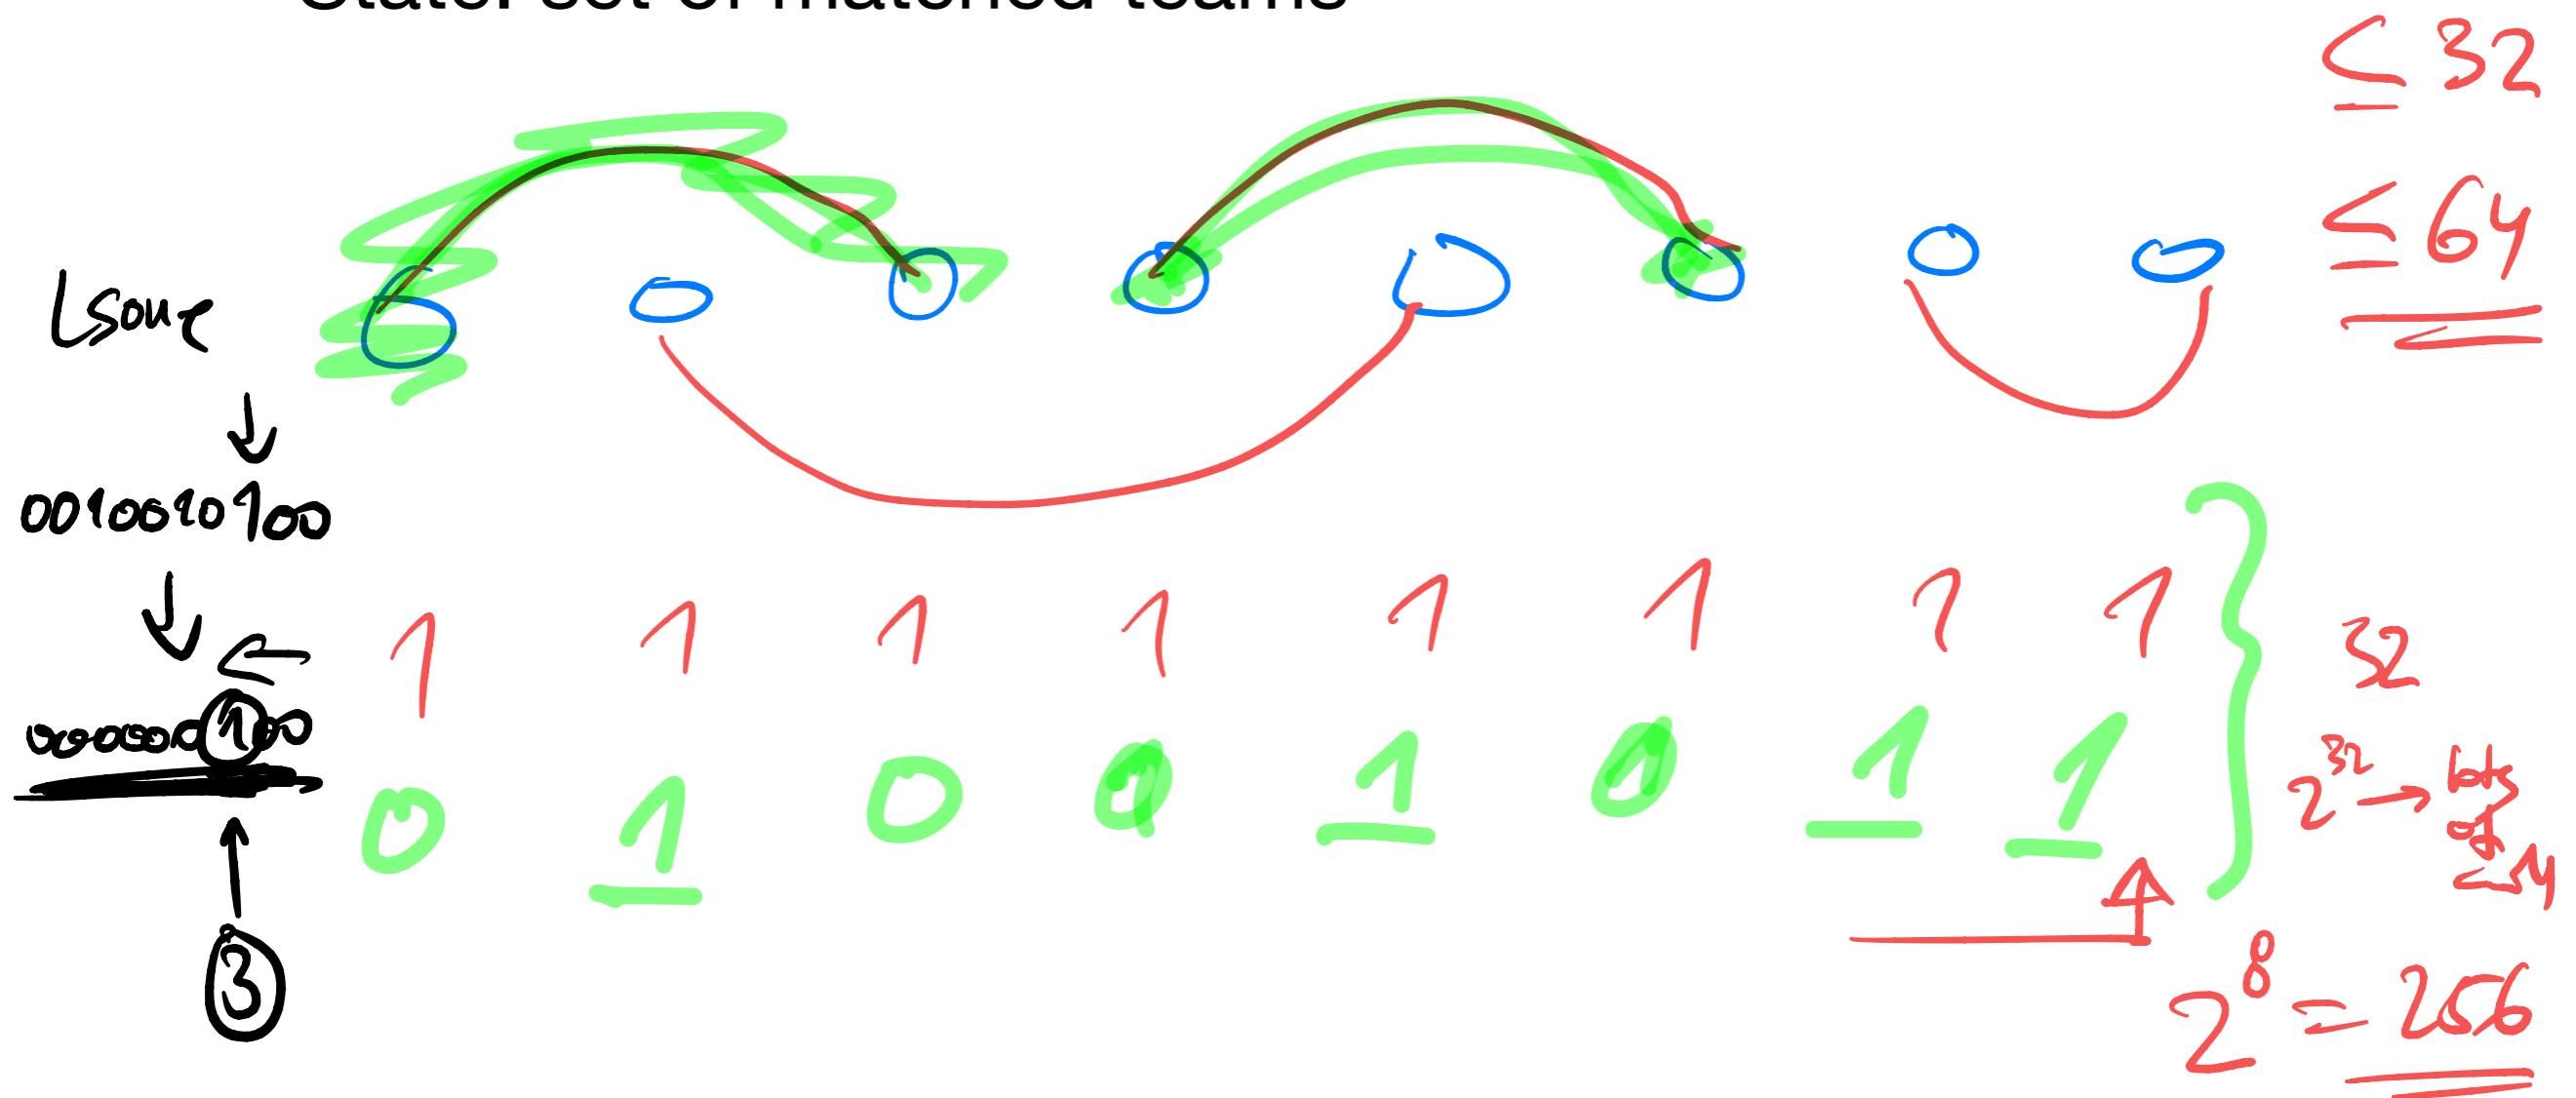

see the code for details

# Pseudo-polynomial memoization

- Similar problems:
  - Counting number of ways to get the change  
(extra state: type)
  - All sorts of knapsack

# Bitmask states

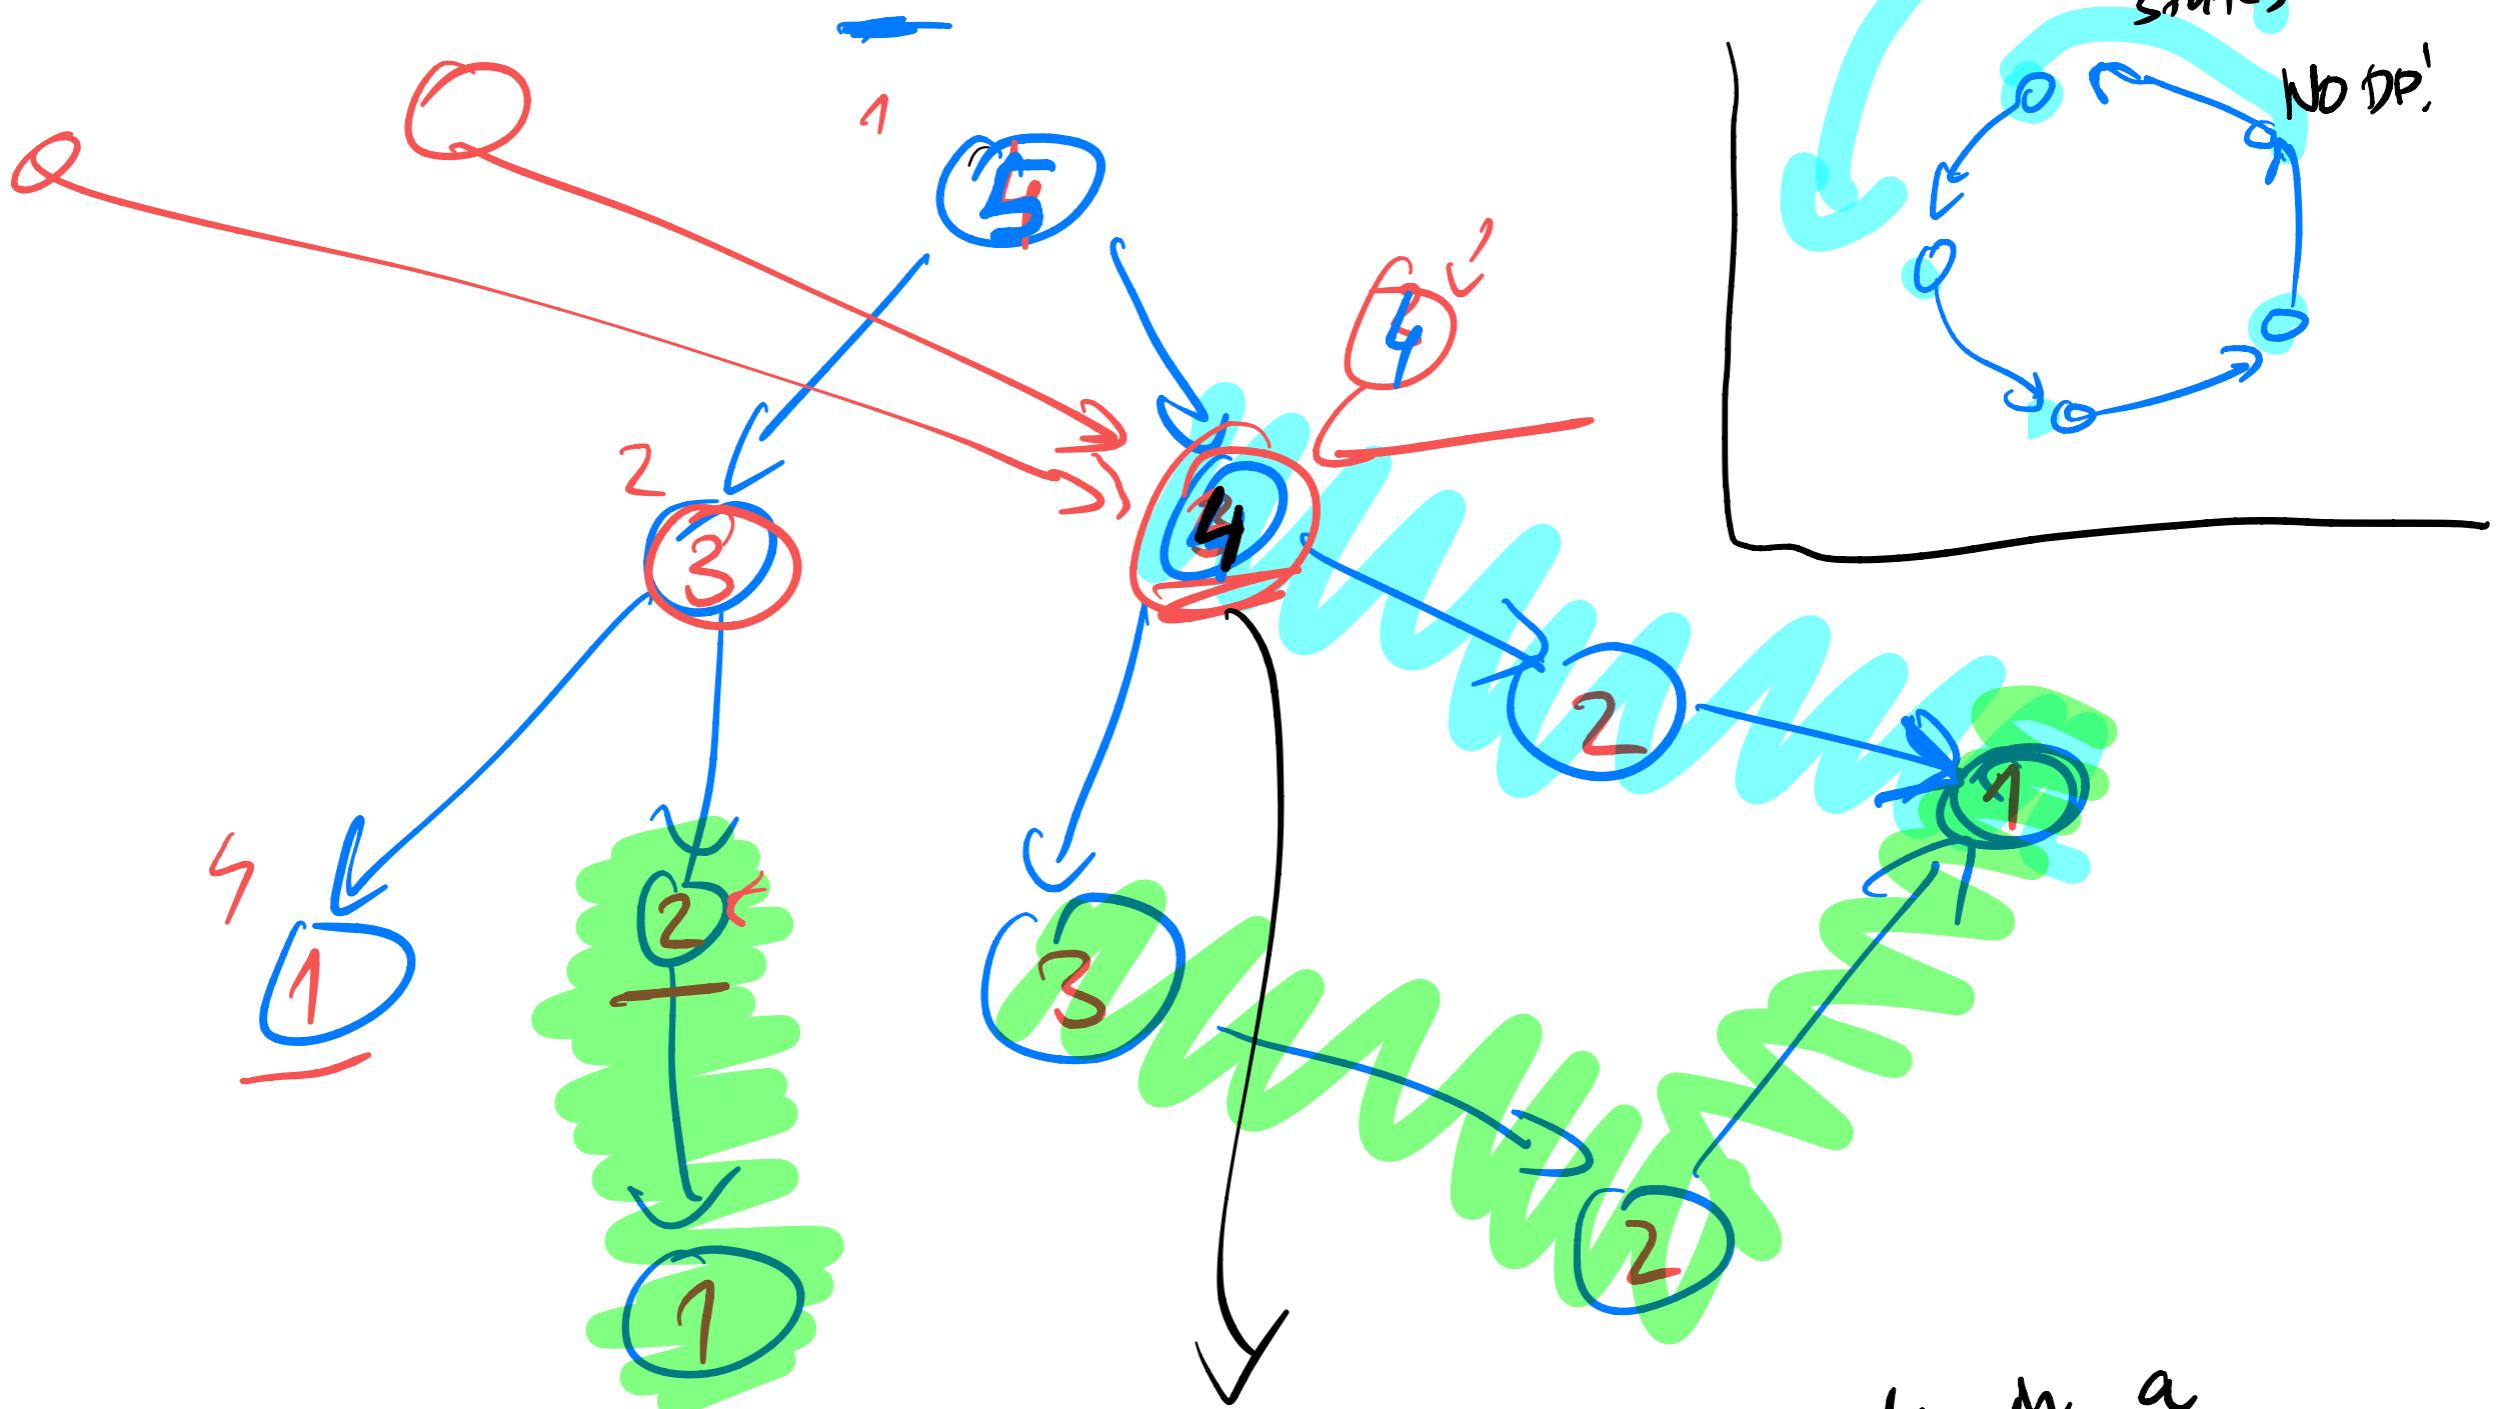

- Problem <https://onlinejudge.org/external/109/10911.pdf>
- State: set of matched teams

# Bitmask states

- Problem <https://onlinejudge.org/external/109/10911.pdf>
- State: set of matched teams

# DAG states

DP state is a node in a  
dir. acyclic graph!

1. Parameter: Index  $i$  in an array, e.g.  $[x_0, x_1, \dots, x_i, \dots]$   
Transition: Extend subarray  $[0..i]$  (or  $[i..n-1]$ ), process  $i$ , take item  $i$  or not, etc  
Example: 1D Max Sum, LIS, part of 0-1 Knapsack, TSP, etc (see Section 3.5.2)
2. Parameter: Indices  $(i, j)$  in two arrays, e.g.  $[x_0, x_1, \dots, x_i] + [y_0, y_1, \dots, y_j]$   
Transition: Extend  $i, j$ , or both, etc  
Example: String Alignment/Edit Distance, LCS, etc (see Section 6.5)
3. Parameter: Subarray  $(i, j)$  of an array  $[\dots, x_i, x_{i+1}, \dots, x_j, \dots]$   
Transition: Split  $(i, j)$  into  $(i, k) + (k+1, j)$  or into  $(i, i+k) + (i+k+1, j)$ , etc  
Example: Matrix Chain Multiplication (see Section 9.20), etc
4. Parameter: A vertex (position) in a (usually implicit) DAG  
Transition: Process the neighbors of this vertex, etc  
Example: Shortest/Longest/Counting Paths in/on DAG, etc (Section 4.7.1)
5. Parameter: Knapsack-Style Parameter  
Transition: Decrease (or increase) current value until zero (or until threshold), etc  
Example: 0-1 Knapsack, Subset Sum, Coin Change variants, etc (see Section 3.5.2)  
Note: This parameter is not DP friendly if its range is very high.  
See tips in Section 8.3.3 if the value of this parameter can go negative.
6. Parameter: Small set (usually using bitmask technique)  
Transition: Flag one (or more) item(s) in the set to on (or off), etc  
Example: DP-TSP (see Section 3.5.2), DP with bitmask (see Section 8.3.1), etc

# Do all the problems here

- CP1 3.5
- CP2 8.3

check all of them!
